## ABSTRACT

This users guide describes the input and operation requirements of a computer code for the analysis and design of wings in transonic flow. A synopsis of the function of the major subroutines in the program is given in addition to a detailed description of the input variables required to run the code. Sample data sets are presented that illustrate the data sequence required for various code options.

## ADMINISTRATIVE INFORMATION

The work presented was a joint effort by Lockheed-Georgia Company and Texas A&M University supported by the Naval Air Systems Command under the cognizance of D. G. Kirkpatrick (NAVAIR-311D AIRTASK WR02302), Navy Contract N00167-81-C-0078-P00004. The authors acknowledges the support of Dr. Tsze C. Tai, contract monitor at David Taylor Ship/Research and Development Center during all phases of this research.

## INTRODUCTION

This users guide describes the inputs required to run the Lockheed-Georgia Direct/Inverse Design Code (ZEBINV) in the analysis and design modes. The following sections include a brief description of how the code works, a detailed description of the required input data, along with sample input decks and an example of the typical output from the code.

## DESCRIPTION OF CODE OPERATION

In the analysis mode, the Lockheed Georgia Direct/Inverse Design Code (ZEBINV) computes the inviscid potential flow about three-dimensional wings using the ZEBRA II algorithm developed by South et al<sup>1</sup>. The conservative full potential equation is solved on a stretched Cartesian grid that is sheared to align with the leading and trailing edges of the wing.

A typical analysis run begins with the inputting of data that define the airfoil geometry at different spanwise control stations, the wing planform geometry, mesh generation parameters, flow solver initialization and control

parameters. Subroutines SECTIN and INPUT control the reading in of all analysis data. After the required data has been input, the program calls routines to generate the computational grid (SETUP) and compute initial flow parameters (INIT). Subroutine ZEBRA is then called to generate the potential flow solution. ZEBRA calls subroutine WNGBC2 to compute and update both wing surface and outer grid boundary condition, subroutine RO to compute the density at grid half points, and subroutine ROCOZ to compute the retarded density coefficients used in the potential flow solver. Subroutine OUTPUT is called at the end of the solution to compute and print output parameters.

When viscous analysis or design is selected, subroutine VISACT is called from ZEBRA to compute the displacement thickness due to the boundary layer and to update the surface boundary conditions to account for the viscous effects. A second viscous flow routine BDLY is called to compute viscous effects during inverse design cases.

Wing/body effects are computed in subroutine WONZ which is called by INIT. WONZ is called prior to the start of the potential flow solution for each grid of a grid sequencing run.

During inverse design cases, two subroutines are called to compute the current wing shape and perform a wing reloft to enforce a desired trailing edge thickness. These subroutines are SHAPE and RELOFT. When relofting is in effect SHAPE is called by RELOFT. RELOFT is called from subroutine ZEBRA at a specified iteration frequency.

The sequencing of the input routines, flow solver, and output routines is controlled by the main program ZEBINV. This program contains logic that allows grid sequencing to be used to speed up the flow solution. The sample data sets presented in the following sections illustrate the use of a sequence of three grids in the flow solution.

#### DETAILED DESCRIPTION OF INPUT

The input data set required by the analysis/design code can be

broken into five distinct types of data. These data types are:

1. Airfoil section ordinates at specified span locations
2. Data to define the wing planform
3. Control parameters for mesh generation and solution initial
4. Wing/Body data
5. Inverse design data

Each different type of data will be described separately. The input be described card by card. This description will contain both definition of the input variable and the input format.

A. Airfoil Section Inputs and Test Case Title

Section ordinates can be defined at up to 11 span locations of the airfoil section ordinates are:

1. TITLE1, TITLE2, ATITLE (3 cards, 8A10)

TITLE1 - Two card test case title and description that

TITLE2 is written to output files.

ATITLE - Airfoil data description.

2. NPAN, INU, INL, KSMTHS (1 card, 8I10)

NPAN - Number of span stations at which airfoil ordinates are to be defined - at least two stations are required (2.LE.NPAN.LE.11)

INU = Number of upper surface airfoil ordinates. Must be the same for all sections .LE. 100.

INL = Number of lower surface airfoil ordinates. Must be

the same for all sections .LE. 100.

RSMTHS = Number of times computed surface slopes are smoothed.

3. XINU(I), I = 1, INU (INU/8 Cards, 8F10.0) x/c at which airfoil upper surface ordinates are input for the wing section.
4. XINL(I), I = 1, INL (INL/8 Cards, 8F10.0) x/c at which airfoil lower surface ordinates are input for the wing section.
5. ZUP(I, 1), I = 1, INU (INU/8 Cards, 8F10.0) upper surface airfoil ordinates (Z/C) at wing root.
6. ZLP(I, 1) I = 1, INL (INL/8 Cards, 8F10.0) lower surface airfoil ordinates at the wing root station.

The airfoil sections at span stations 2 through NPAN are defined by the following sequence of cards.

7. ISAMX, ISAMZ (1 Card, 2L5).

ISAMX = T ordinates will be defined at the x/c locations of the root section.

= F new x/c locations will be input. The corresponding z/c ordinates will then be splined onto the root X/C locations.

ISAMZ = T use ordinates for previously defined station.

= F input new z/c ordinates.

8. If ISAMX = T AND ISAMZ = F, repeat cards 5 and 6 after 7.
9. If ISAMX = F and ISAMZ = F, repeat cards 3 through 6 after card 7.

10. To use airfoil section defined at station N-1 at station N,  
repeat card 7 with ISAMX = T and ISAMZ = T.

Planform Geometry

1. Header (2X)

2. PTITLE (1 Card, 8A10)

80 character wing planform description

3. YROOT, XLER, XTER, YTIP, XLET, XTET, SREF, CREF, XMON (2  
Cards, 6F10.0)

These variables define trapezoidal reference wing:

YROOT = Y coordinate of root  
XLER = X coordinate of L.E. at root  
XTER = X coordinate of T.E. at root  
YTIP = Y coordinate of tip  
XLET = X coordinate of L.E. at tip  
XTET = X coordinate of T.E. at tip  
SREF = Wing reference area (Semi Span Area)  
CREF = Reference chord  
XMON = Moment reference

4. NLES (1 Card, 8I10)

NLES = Number of segments input to describe the leading  
edge (NLES.LE.3).

5. NLEI (1 Card, 8I10)

NLEI = Number of Y,X pairs defining leading edge  
(NLEI.LE.10).

6. YLEI(I),XLEI(I),I=1,NLEI (NLEI/4 Cards, 8F10.0)

YLEI,XLEI = Y,X pairs defining the leading edge segment

At least two pairs required.

Same dimensional system as XLER, etc.

7. DXLER,DXLET (1 Card, 8F10.0).

DXLER = DX/DY of L.E. at inboard edge of segment

DXLET = DX/DY of L.E. at outboard edge of segment

Note: Repeat cards 5 through 7 NLES times

8. NTES (1 Card, 8I10)

NTES = Number of segments input to describe the trailing  
edge (NTES.LE.3)

9. NTEI (1 Card, 8I10)

NTEI = Number of Y,X pairs defining trailing edge segment

(NTEI.LE.10).

10. YTEI(1),XTEI(1),I=1,NTEI (NTEI/4 Cards, 8F10.0)

YTEI,XTEI = Y,X pairs defining the trailing edge segment

At least two pairs required

11. DXTER,DXTET (1 Card, 8F10.0)

DXTER = DX/DY of T.E. at inboard edge of segment

DXTET = DX/DY of T.E. at outboard edge of segment

NOTE: Repeat cards 9 through 11 NTES times

12. YP(N),THETP(N),N=1,NPAN (NPAN/4 Cards, 8F10.0)

YP = Fraction of semispan at which airfoils are defined

THETP = Twist Angle, degrees, at YP - Positive if leading edge is up

#### C. Mesh Generation and Solution Parameters

A set of five namelists are used to input values that control mesh generation, solution initialization and solution sequencing. Namelist GPARM, XGRID, YGRID, and ZGRID are used in mesh generation. Namelist SOLVIN is used to put flow solver parameters. A sixth namelist VISCDT is input after SOLVIN if IVISC = 1 in SOLVIN. This set of namelists must be input for each grid in a grid sequencing run; however, only those values that change from grid to grid must be redefined. The namelists and the input parameters required for analysis runs are:

1. TITLEM (1 Card, 8A10)

Namelist set description

2. GPARM (Namelist input - Default values in parenthesis)

IPRNTG = 1 - Prints computational grid (0)

WBCPRT = .T. - Prints upper and lower surface slopes at each spanwise grid station (.F.)

NTIPLE = 1 - Generates a constant chord tip extension with tip section sweep from wing tip to outer boundary

3. XGRID (Namelist input)

NXON - Number of streamwise mesh points on wing surface at each span station

NXFWD- Number of streamwise mesh points ahead of the wing leading edge

NXAFT- Number of streamwise mesh points aft of the wing trailing edge

XPLE - Grid stretching factor for grid in front of wing; computed in MESHZ for XFWD .NE.0

XPTE - Grid stretching factor for grid behind wing; computed in MESHZ forXAFT .NE.0

XFWD - Desired location of the upstream boundary referenced to the leading edge of the wing (in root chords).

XAFT - Desired location of the downstream boundary referenced to the leading edge of the wing (in root chords).

4. YGRID (Namelist input)

NYON - Number of spanwise grid points on wing surface

NYOFF- Number of spanwise grid points off of the wing surface

YPTIP- Grid stretching factor for grid beyond wing tip, computed in MESHZ when YMAX .NE.0

YMAX - Desired location of the spanwise outer boundary referenced to the wing tip (in semi-spans). For example, YMAX=1.3 places the spanwise boundary at 1.3 semi-spans beyond the wing tip.

5. ZGRID (Namelist input)

NZ - Number of vertical grid points

ZP - Grid stretching factor for vertical direction. The grid is stretched equally above and below the  $z = 0$  plane.  
Computed in MESHZ when ZMAX .NE.0

ZMAX - Desired location of the top and bottom boundaries of the computational plane (in root chords).

6. SOLVIN (Namelist input)

MACH - Free-stream Mach number for test case

AOA - Wing angle of attack in degrees

OMEGX

OMEGY- Relaxation parameters for the x, y, and z directions

OMEGZ

OMEGG- Relaxation factor for circulation

MAXIT- Maximum number of iterations of the flow solver

RCONV- Convergence tolerance = the ratio of current maximum residual and initial residual

NGSEQ- Number of grids to be used in grid sequencing runs

IPRINT = 1 - Calls output to print flow solution parameters

IPLOT = 1 - Writes plot data to a specified logical unit for  
           post-processing

IVISC = 1 - Selects viscous analysis/design mode

IFUSE = 1 - Turn on wind body effects with circular cylinder  
           fuselage

          = 2 - Turn on wing body effects using input fuselage  
                 cross-sections

ICIRPF - Spanwise circulation distribution print frequency  
           Prints every ICIRPF iterations

IKLUNK = 1 - Updates outer boundary potentials using Klunkers  
           expressions

          = 0 - Sets outer boundary potentials to zero

IPU - Logical unit to which plot data will be written

IINV = 1 - Perform inverse design

IDESN = 1 - Design both upper and lower surfaces

          = 2 - Design upper surface only

          = 3 - Design lower surface only

IRLOFT = 1 - Start wing re lofting for trailing edge closure on initial  
           grid for NGSEQ.NE.0

          = 2 - Start wing re lofting for trailing edge closure on second  
                 grid for NGSEQ.NE.0.

          = 3 - Start wing re lofting for trailing edge closure on third  
                 grid for NGSEQ.NE.0.

NF - Number of fuselage control points used to evaluate wing/body effects (50 or less)

NITRL - Perform NITRL iterations before first wing reloff

NITRF - Reloff wing every NITRF iterations

NJSHP - Print reloffed data every NJSHP span stations

NITDSN - Perform NITDSN iterations prior to start of inverse design

ILED - Initial chordwise index to begin inverse design

ITED - Trailing edge index

ISVSHP - Save inverse shapes at end of run

IRSTRT - Restart from previous run

ISRLOR - Save reloffed ordinates for restart runs

IPRSHP - Print reloffed shapes

7. VISCDT (Namelist input) - only if IVISC .NE. 0 in SOLVIN

RN - Reynolds number based on root chord

DELCOR - Square of the cosine of an appropriate sweep angle such as the mid-chord used to modify boundary layer calculation for 3D effects

NVISC - Number of potential flow solver iterations prior to first viscous update

ITR    - Updates viscous corrections every ITR iterations after first update  
 NPRV   - Print viscous flow information every NPRV iterations  
 NJPRV   - Print viscous information every NJPRV span stations  
 XIBDLY - X/C location of transition point for both upper and lower surfaces  
 XSEP   - X/C location before which the separation parameter, SEP, is restricted to a maximum value of 0.004. After XSEP, SEP can have any value  
 XPCI   - Lower surface X/C location after which a decreasing lower surface displacement thickness is forced to continue decreasing

#### D. Wing/body Data

The format of the wing/body data depends on the value of IFUSE entered in namelist SOLVIN. If IFUSE = 1, the fuselage is simulated by a circular cylinder with elliptic end caps. If IFUSE=2, the cross-sectional areas of the fuselage are input, see sample cases 4 and 5. The wing/body input is performed only once during a grid sequencing run, usually a call to SOLVIN.

The input sequence for the wing/body data is:

1. Header card (1X)
2. XBOD,YBOD,ZBOD, RBOD, TL, ALF (8F10.6)

XBOD - Distance from nose of fuselage to leading edge of wing at the wing root

YBOD - Distance from centerline of the body to the wing root

ZBOD - Distance from centerline of the body to the centerline of the wing (positive is up)

RBOD - Radius of circular cylinder body for IFUSE = 1

TL - Length of the fuselage

ALF - Length of semimajor axis of ellipsoidal ends for IFUSE=1

if IFUSE = 2, input:

3. Header card (1X)

4. NST - Number of cross-sections to be input (I5)

5. XFL(I), AREA(I), I=1,NST (3F10.6)

XLF - % Fuselage length

AREA - Cross-sectional area at XFL

#### E. Inverse Design Input

When IINV=1 in SOLVIN, the target pressure distribution for the specified span stations must be input. If IDESN=1, the target pressures for both the upper and lower surfaces are input. If IDESN = 2 or 3, the target pressures for either the upper or the lower surface are input. The card sequence for the inverse design input is as follows; see sample data set 6:

1. Header card (1X)

2. JD1,JD2,NCPS (3I5)

JD1 - Index of initial spanwise inverse design station

JD2 - Index of final spanwise design station

NCPS - Number of chordwise points in the target pressure distribution

3. XUD(J,I), I=1,NCPS - Upper surface target Cp X/C locations (7F10.6)
4. CPDU(J,I), I=1,NCPS - Lower surface target Cp values (7F10.6)
5. XLD(J,I), I=1,NCPS - Lower surface target Cp X/C locations (7F10.6)
6. CPDL(J,I), I=1,NCPS - Lower surface target Cp values (7F10.6)

Repeat cards 3 through 6 for J=JD1,JD2

Omit cards 5 and 6 for IDESN=2

Omit cards 3 and 4 for IDESN=3

If relofting (IRLOFT .GT. 0) is selected for either viscous or inviscid design cases, the desired trailing edge ordinates of the surface being designed is input after the target pressure data. The card sequence for the relofting data is as follows:

1. Header card (1X)
2. NTE - Number of relofting stations input. This should be equal to the number of design stations (IS)
3. ZUTED(I) ,I=JD1,JD2 - Desired upper surface ordinate of design airfoil. (7F10.0)
4. ZLTED(I) ,I=JD1,JD2 - Desired lower surface ordinate of design

airfoil. (7F10.0)

Omit cards 4 for IDSN=2.

Omit cards 3 for IDSN=3.

#### DESCRIPTION OF OUTPUT

##### PRINTED OUTPUT

A typical output will have three sections. In the first section, the parameters that were input to define the wing geometry are echoed. The x location of the wing leading and trailing edges and slope of the leading edge and trailing edge lines at different span stations are printed along with the computed planform geometry parameters such as aspect ratio and taper ratio. These values are normalized by the root chord. The next section of data is generated during the solution process. At the end of each iteration, the iteration number, the grid indices and values of the maximum correction and residual, the number of supersonic points, the current wing lift coefficient based on circulation and the average residual are printed. If IPRINT = 1 subroutine OUTPUT will be called to compute and print the section lift drag, and moment coefficients and the chordwise upper and lower surface pressure coefficient, density and mach number distributions at each spanwise grid station. A printer plot of the pressure coefficients is also generated.

During inverse runs the relofted shape is printed every NSHPF iterations. If relofting has been selected, the correction to the trailing edge thickness applied at each design station is printed.

When viscous analysis or design is selected, a summary of the boundary layer parameters are printed everyd NPRV updates of the boundary layer for both the upper and lower surfaces of the wing. In addition, a summary of the trailing edge displacement thickness at each wing station is printed every time the boundary layer is recalculated along with the computed skin

friction coefficient. The boundary layer summary includes printout of the local Reynolds number used in the boundary layer calculation, the local Mach number, the displacement thickness, the momentum thickness, and the separation index. A printer plot of wing sections before and after application of the displacement thickness is also printed every NPRV iterations.

#### MASS STORAGE OUTPUT

When the IPLOT flag is set, the program will output data to mass storage for plotting or other post-processing. The majority of data written to mass storage will be stored on logical unit 9. However, additional data will be stored on other units for design or viscous analysis runs. The definitions of these data are discussed in the following sections. The order and format of the data can be obtained from a listing of subroutine PLTOUT.

#### Data Stored on Logical Unit 8

TITLE1 - Test case title and description from input

TITLE2 - Test case title and description from input

MACH - Freestream mach number

AOA - Wing angle of attack

CLW - Computed wing lift coefficient

CDW - Computed wing drag coefficient

CMW - Computed wing pitching moment coefficient

CLG - Wing circulation lift coefficient

SREF - Wing reference area

CROOT - Wing root chord length  
 SPAN - Wing semi-span length  
 AR - Wing aspect ratio  
 JTPM1 - Number of chordwise computational grid planes on the wing  
 IDUM - Dummy integer  
 J - Index of chordwise grid plane along semi-span  
 ETA - Spanwise distance of grid plane J from the root normalized  
 by the semi-span.  
 XLEW - X coordinate of wing leading edge on grid plane J  
 XTEW - X coordinate of wing trailing edge on grid plane J  
 CORDW - Local wing chord at grid plane J  
 NXB - Number of chordwise grid points on wing at grid plane J  
 JTIP - Index of the first grid plane off of the wing  
 YTIP - Eta location of the wing tip  
 XLET - X coordinate of the wing tip leading edge  
 XTET - X coordinate of the wing tip trailing edge  
 CTIP - Wing tip chord  
 XIN - X/C location of computed data  
 CPL - Lower surface pressure coefficient

CPU     - Upper surface pressure coefficient  
  
 CLS     - Sectional lift coefficient at grid plane J  
  
 CDS     - Sectional drag coefficient at grid plane J  
  
 CMS     - Sectional moment coefficient at grid plane J  
  
 TWIST   - Twist angle of airfoil section at grid plane J  
  
 ZOCU    - Wing section upper surface ordinates at computational grid  
           X/C's. For viscous analysis and design these values will  
           be for the fluid airfoil.  
  
 ZOCL    - Wing section lower surface ordinates at computational grid  
           X/C's. For viscous analysis and design these values will  
           be for the fluid airfoil.  
  
 DZXU    - Wing section upper surface slopes at computational grid  
           X/C's. For viscous analysis and design these values will  
           be for the fluid airfoil.  
  
 DZXL    - Wing section lower surface slopes at computational grid  
           X/C's. For viscous analysis and design these values will  
           be for the fluid airfoil.  
  
 INU     - Number of chordwise points used to define initial airfoil  
           section upper surface.  
  
 INL     - Number of chordwise points used to define initial airfoil  
           section lower surface.  
  
 ZUPI    - Airfoil section upper surface ordinates interpolated from  
           the original input airfoil sections. ZUPI will change if  
           relofting is used in design runs.

ZLPI - Airfoil section lower surface ordinates interpolated from original input airfoil sections. ZLPI will change if re lofting is used in design runs.

ITCNT - Total number of iterations on all grids used in solution.

NSPT - The number of supersonic points at a given iteration.

CLGT - The circulation lift at a given iteration.

RMAXT - The maximum residual at a given iteration.

CMAXT - The maximum correction at a given iteration.

ZINU - X/C location of input airfoil upper surface ordinates.

XINL - X/C location of input airfoil lower surface ordinates.

XINUS - Initial values of XINU saved when IDESN .NE. 0.

XINLS - Initial values of XINL saved when IDESN .NE. 0.

ZUPS - Initial values of ZUPI saved when IDESN .NE. 0.

ZLPS - Initial values of ZLPI saved when IDESN .NE. 0.

Data Stored on Logical Unit 9 when ISVSHP .NE. 0.

TITLE1 - Test case title and description from input

NJD - Total number of inverse design stations

ETA - Spanwise distance of grid plane J from the root normalized by the semi-span.

NXB - Number of chordwise grid points on wing at grid plane J

XIN - X/C location of computed data

Data Stored on Logical Unit 20 when IVISC .NE. 0.

TITLE1 - Test case title and description from input

JTPM1 - Number of chordwise computational grid planes on the wing

NXB - Number of chordwise grid points on wing at grid plane J

XIN - X/C location of computed data

DPUOLD - Upper surface boundary layer displacement thickness

DPLOLD - Lower surface boundary layer displacement thickness

#### RESTART DATA

Data to restart either an analysis or design case from a previous run is stored on units 7 and 14 by subroutine SAVSOL. At the end of each case, the computational grid, reduced potential and circulation are stored in unformatted form on logical unit 7. For inverse design cases, the reloaded ordinates resulting from the design are stored on logical unit 14 whenever ISRLOR .NE. 0.

APPENDIX A  
SAMPLE DATA SETS

The following sample data sets were used in the evaluation of the direct/inverse design method.

SAMPLE DATA SET NO. 1  
ONERA M6 VISCOUS INVERSE AT J=12

M6 VISCOUS INVERSE AT ONE STATION (J=12) USING MODIFIED CP'S
